

# “Juicy” feedback

Feedback can provide players rewarding experiences, just by its design.

- Varied, unexpected, excessive sensual positive feedback on small user actions and achievements
- Can instill a sense of competence and control even when there is no big challenge to overcome
- Can invoke curiosity and surprise with unpredictable variations and engage continuous play
- Player feels that their inputs have a tangible effect

(Deterding, 2015)

# The concept of 'meaningful play' should be considered when designing gamified interactive systems

Discernability + Integration = Meaningful play

1. **Discernability** is all about **acknowledging** the players action (e.g., instant and clear feedback to the players actions).

2. **Integration** is all about making the players actions **feel important** (e.g., actions have consequences / changing the game state).

(Salen & Zimmerman, 2003)

## Feedback that supports the player's experience

Good feedback gives players the experience that they are in full control of the game and that their **actions are meaningful**, which means their activity results in immediate, clear and relevant outcomes (e.g., accomplishments). Otherwise, players will lose their interest quickly.

## Don't interrupt the user's goal pursuit

Good feedback should not interrupt users on their process of accomplishing a goal or task. Hence, **juicy feedback** – which tends to absorb a non-trivial amount of time and attention – is appropriate when the user has achieved the closure of a certain goal: The more involving the feedback, the more significant the closure should be.

## Ensure slightly unpredictable variety

Users get accustomed to any kind of feedback quickly, such that the surprise value and sense pleasure of juicy feedback can diminish to the point where a drawn-out celebratory sequence where the user is denied agency may become boring, trite, and frustrating. Consider how you might add **variation to the feedback** to keep it fresh, or to include **a slow reveal of information** in the feedback to keep the user interested.

## Systematically think through "interesting moments"

One useful way of thinking through how you might increase the juiciness of feedback is to **systematically map out and work through** what interaction designer Bill Scott has called "**interesting moments**": All the minute sub-states and steps of a single interaction, e.g., mouse movement, hover, click, initiated drag, continuing drag, hovering over valid target, or mouse release in a "simple" drag-and-drop interaction.
